

Subsea - Offshore & Marine

Remotely operated vehicles, subsea trenching, submerged mining, vessel steering and stabilisation.

Deep below the ocean's surface is an extremely challenging environment for any machine. With remotely operated vehicles working thousands of metres below the surface, repairing an oil pipeline, searching for a missing aircraft or excavating a trench line, failure is not an option. Star Hydraulics valves have been selected by OEM's and are also supplied as replacement valves. Worldwide support ensures that ROV's work faultlessly in the most extreme conditions.
